

Skills Summary

Teen Numbers: One Ten and Some Ones

Use this reference while completing your worksheet or when studying.

Skill 1 — Breaking a teen number into ten and ones

Rule: Every teen number is *one ten and some ones*.

To find the ones, take the ten out of the number: $\text{ones} = \text{number} - \text{ten}$.

Model: fill one ten-frame first. Whatever is left over sits outside the frame, and that leftover is the ones.

Example: 15 is one ten and how many ones?

Step 1. I want the leftover after one ten is set aside, and the ten-frame sets exactly one ten aside, so I fill the frame first and count what stays outside.

Step 2. Filling the frame uses ten of the counters, so the leftover is $15 - 10$, which is five.

5 ones

Try it: 12 is one ten and how many ones?

check: 2 ones

(!) Watch out: Do not count the ten again. Once the frame is full it stands for one whole ten, so only the counters *outside* the frame are the ones.

Skill 2 — Building a teen number from ten and ones

Rule: Going the other way, put the ten first and count the ones on: $\text{number} = \text{ten} + \text{ones}$.

Start your count at ten — never back at one — and say one number word for each loose counter.

Example: One full ten-frame and 7 loose counters. What number is that?

Step 1. The frame is already worth a whole ten, so instead of counting every counter I start the count at ten and count on the loose ones.

Step 2. Counting on from ten — eleven, twelve, thirteen, fourteen, fifteen, sixteen, seventeen — lands on seventeen. In notation that is $10 + 7$.

17

Try it: One full ten-frame and 3 loose counters. What number is that?

check: 13

Skill 3 — Comparing two teen numbers

Rule: Both teen numbers hold exactly one ten, so the tens can never break the tie.
Compare the *ones*: the teen number with more loose counters is the greater one.

Example: Write $<$, $>$, or $=$ between 16 and 13.

Step 1. Both are teen numbers, so each is built from one full frame plus some loose counters; the frames match, and that leaves only the loose counters to decide.

Step 2. Set the two full frames side by side and they cancel. The first number has more counters left outside than the second, so the first is greater and the wide end faces it.

16 > 13

Try it: Write $<$, $>$, or $=$ between 11 and 15.

11 > 15 check
