

Fixing Shares That Are Not Really Halves or Fourths

Directions

- *Halves* are two parts of the **same size**. *Fourths* are four parts of the same size.
 - Cutting something into two pieces does not always make halves — the pieces must match.
 - Every strip on this page is made of equal squares. Count the squares in a part to find its size.
-

1. Jonah cut this strip of 8 squares into two parts and called them halves.

- (a) Count the squares in each part. Write $<$, $>$, or $=$ between them: A _____ B
- (b) How many squares would each true half have? _____
- (c) Explain why Jonah's two parts are not halves.
-
-

2. Mira cut this strip of 8 squares into four parts and called them fourths.

- (a) Compare the biggest part with the smallest part. Write $<$, $>$, or $=$: A _____ D
- (b) How many squares would each true fourth have? _____
- (c) Explain why Mira's four parts are not fourths.

3. This longer strip of 12 squares was cut into two parts and labelled halves.

- (a) Count the squares in each part. Write $<$, $>$, or $=$: A _____ B
- (b) How many squares should each half of this strip have? _____

4. Theo cut this strip of 12 squares into four parts and labelled them fourths.

- (a) Compare part A with part D. Write $<$, $>$, or $=$: A _____ D
- (b) How many squares should each fourth of this strip have? _____
- (c) Explain which parts must change, and how.

5. Priya cut this rectangle of 8 squares into two parts of different shapes and called them halves.

- (a) Count the squares in each part. Write $<$, $>$, or $=$: A _____ B
- (b) How many squares should each half of this rectangle have? _____
- (c) Explain why two parts of different shapes can still fail to be halves, and how you would fix this cut.

6. Ella says: “The more pieces you cut, the bigger each piece is.” She shared one strip of 12 squares into equal halves, and another strip just like it into equal fourths.

- (a) How many squares are in each half? _____
- (b) How many squares are in each fourth? _____
- (c) Explain whether Ella is right.
