

Subtracting Two-Digit Numbers with Place-Value Blocks

Directions

- In every picture, a tall rod is one ten and a small square is one.
 - Cross out blocks to take away. Start with the ones.
 - If there are not enough ones, open one rod into ten ones first — that is regrouping. The total does not change, only how it is shown.
-

1. The blocks show 47. Cross out 23 and write what is left.

$$47 - 23 = \underline{\hspace{2cm}}$$

- 2.** The blocks show 68. Cross out 35 and write what is left.

$$68 - 35 = \underline{\hspace{2cm}}$$

- 3.** The blocks show 52. There are not enough ones to take away 27, so open one rod into ten ones first, then cross out.

$$52 - 27 = \underline{\hspace{2cm}}$$

4. The blocks show 64. Open one rod into ten ones, then cross out 28.

$$64 - 28 = \underline{\hspace{2cm}}$$

5. The blocks show 71.

- (a) Round each number to the nearest ten, then subtract the rounded numbers. $71 - 38 \approx$
 $\underline{\hspace{2cm}}$

- (b) Now use the blocks to find the exact answer. $71 - 38 = \underline{\hspace{2cm}}$

6. A jar held 82 marbles. A player took 45 marbles out. The blocks show what was in the jar to start with. How many marbles are left in the jar?

Answer: _____ marbles

7. Sam worked out $63 - 27$ with these blocks and wrote 44.

(a) Work it out correctly with the blocks. $63 - 27 =$ _____

(b) Explain what Sam did wrong.

8. The blocks show 94.

(a) Round each number to the nearest ten, then subtract. $94 - 47 \approx$ _____

(b) Now use the blocks to find the exact answer. $94 - 47 =$ _____

(c) Explain why your estimate landed below the exact answer.
