

Fractions: Equal Parts Fix-It

Directions:

- A fraction can only be named when the whole is cut into *equal* parts.
- Some students in these problems made a mistake. Find it, fix it, and show your thinking in the work space.

1. This rectangle is cut into 4 equal parts, and 1 part is shaded. Write the fraction of the rectangle that is shaded.

Answer: _____

2. Mia cut this circle into three parts and shaded one part. The parts are *not* all the same size. Mia says the shaded part is one third of the circle. Say why Mia cannot call the shaded part one third yet.

Answer: _____

3. Rectangle A and Rectangle B are the same size. Each one is cut into four parts, and each one has one part shaded.

- (a) What fraction of Rectangle A is shaded? _____
- (b) Circle the letter of the rectangle that *truly* shows one fourth, and tell how you know.

4. Deshawn split this rectangle into three parts using the heavy lines, and he shaded the small part. He says: “The shaded part is $\frac{1}{3}$ because it is 1 part out of 3.”

- (a) Count the small equal squares. How many small squares make the whole rectangle?

- (b) What fraction of the rectangle is *really* shaded? _____
- (c) Name Deshawn’s mistake.

5. Priya drew a number line from 0 to 1. Her line is 8 cm long. She made tick marks that are *not* evenly spaced, and she labeled the first mark $\frac{1}{4}$.

- (a) To show fourths correctly, the tick marks must cut the line into 4 equal lengths. How many centimeters apart should Priya's tick marks be?

Answer: _____ cm

- (b) Say what was wrong with Priya's number line.

6. Ben folded a paper strip into two parts. He says each part is one half. Then he measures: one part is 12 cm long and the other part is 8 cm long.

12 cm	8 cm
-------	------

- (a) Is Ben right? Say how you know.

- (b) If the same strip were folded into 2 *equal* parts, how long would each part be?

Answer: _____ cm

7. Tia's garden is split by heavy lines into 4 sections that are *not* all the same size. The shaded tomato section covers 4 small squares. Tia says: "Tomatoes take up $\frac{1}{4}$ of the garden, because tomatoes are 1 section out of 4."

(a) Use the small squares. What fraction of the garden do the tomatoes *really* cover?

(b) Explain what Tia got wrong.

8. Now draw your own correct model. The grid below shows 3 rows of 4 small squares.

(a) Draw straight lines to cut the grid into six *equal* parts, then shade one part.

(b) How many small squares are in each equal part? _____

(c) What fraction of the whole rectangle is one small square? _____
