Curriculum

Level: Grade 3

3.MD – problems 1, 2, 3, 4, 5, 6, 7, 8, 9, 10

Difficulty 1–4 of 5 across 10 tagged checks.

1. A pear has a mass of 154 g. An apple has a mass of 138 g. What is the total mass of the two fruits together?

Solution: “Together” means put the masses in one group, so add: $154 + 138 = 292$. The total mass is 292 g

2. A bottle holds 500 mL of juice. Amir pours out 175 mL. How many milliliters of juice are left in the bottle?

Solution: Juice is taken away, so subtract what was poured from what the bottle held: $500 - 175 = 325$. There are 325 mL of juice left.

3. One brick has a mass of 2 kg. What is the mass of a stack of 9 bricks?

Solution: There are 9 equal groups of 2 kg, so multiply: $9 \times 2 = 18$. The stack has a mass of 18 kg

4. A cooler holds 24 L of lemonade. It is poured equally into 4 jugs. How many liters of lemonade go into each jug?

Solution: One total is shared into equal groups, so divide: $24 \div 4 = 6$. Each jug gets 6 L

5. A bag of rice has a mass of 750 g. A bag of beans has a mass of 425 g. How much more mass does the bag of rice have than the bag of beans?

Solution: “How much more” compares the two masses, so subtract the smaller from the larger: $750 - 425 = 325$. The rice has 325 g more mass.

6. A fish tank holds 38 L of water. Keiko adds 17 L more. How many liters of water are in the tank now?

Solution: Water is added to what is already there, so add: $38 + 17 = 55$. The tank now holds 55 L

7. One spoonful of cough medicine is 5 mL. Dev takes 7 spoonfuls during the whole week. How many milliliters of medicine is that in all?

Solution: There are 7 equal spoonfuls of 5 mL, so multiply: $7 \times 5 = 35$. Dev takes 35 mL in all.

8. A farmer divides 56 kg of potatoes equally into 8 sacks. How many kilograms of potatoes go into each sack?

Solution: One total is split into 8 equal shares, so divide: $56 \div 8 = 7$. Each sack holds 7 kg

9. The pan balance is level. The left pan holds a bag of flour; the right pan holds a 400 g weight and a 250 g weight together. What is the mass of the bag of flour?

Solution: A level balance means both pans hold the *same* mass. The right pan holds $400 + 250 = 650$ grams, so the flour must match it. The bag of flour has a mass of 650 g

10. A measuring jug holds 900 mL of water. Lena pours all of the water equally into 3 glasses. How many milliliters of water go into each glass?

Solution: The whole 900 mL is shared into 3 equal glasses, so divide: $900 \div 3 = 300$. Each glass gets 300 mL
