

Place-Value Synthesis Review

Expanded form, comparing numbers, and rounding decisions

Directions: After the warm-up, the three skills are mixed together — read each problem carefully and decide *which* tool it needs before you start. The last problem uses all three at once.

1. Write in standard form: $60,000 + 2,000 + 400 + 9 =$ _____

2. Fill in the missing addend:

$$8,315 = 8,000 + \underline{\hspace{2cm}} + 10 + 5$$

3. Write $<$, $>$, or $=$:

$$36,254 \quad \underline{\hspace{2cm}} \quad 36,245$$

4. Round 7,438 to the nearest hundred.

Answer: _____

5. Which number is $30,000 + 500 + 20 + 8$?

Answer: _____

6. Round 52,499 to the nearest thousand. (Think: is 499 enough to round up?)

Answer: _____

7. Order from least to greatest: 8,742; 8,724; 8,772
least _____ middle _____ greatest _____

8. Round 63,970 to the nearest hundred.

Answer: _____

9. First write the total in standard form:

$$40,000 + 3,000 + 70 = \underline{\hspace{2cm}}$$

Then write $<$, $>$, or $=$: that total 43,900

10. A wildlife count finds 45,067 ducks. One report rounds the count to the nearest thousand: _____. Another rounds it to the nearest hundred: _____.

Which rounded number is closer to the actual count? Say which and show how far away each one is.

11. Ben says $76,099 > 76,105$ “because 76,099 ends in two nines.” Write the correct symbol: 76,099 _____ 76,105.

Then explain what Ben did wrong.

12. Three games had attendances of 41,807, 41,490, and 42,088.

(a) Order them from greatest to least: _____

(b) Round the greatest attendance to the nearest hundred: _____

(c) Which two attendances round to the *same* nearest-thousand value? Explain how you decided.
