What is verified

6 of 8 problems fully machine-checked against SymPy.
 — marks an answer only you can judge — problems 5, 6. The worked solution states what a correct response must contain.

Curriculum

Level: Kindergarten–Grade 1

K.CC.A.3 – *problems 1, 2, 4, 6, 8*

K.CC.B.5 – *problems 3, 5*

K.CC.C.7 – *problems 7, 8*

Difficulty 1–4 of 5 across 12 tagged checks.

- 1.** A row of dots — write the numeral that matches.

Solution: Count one-to-one: “one, two, three.” The quantity is three, and the numeral that shows three is 3

- 2.** The word card says *seven*. Write the numeral.

Solution: The word *seven* names the same number as the numeral 7 — word and numeral are two ways to write one number. The numeral is 7

- 3.** Ten-frame: full top row and one more dot. Write the numeral.

Solution: The full top row is 5. Count on for the bottom row: “six.” $5 + 1 = 6$, so the numeral is 6

- 4.** The word card says *nine*. Write the numeral.

Solution: *Nine* is the number word just before ten in the counting sequence, so the matching numeral is 9

5. The numeral card shows 8. Draw that many dots.

Solution (instructor-judged): the numeral 8 tells the child to draw exactly eight dots. Count the drawn dots one-to-one: eight dots earns credit, in any arrangement — rows of four, a ten-frame layout, or a scatter. Seven or nine dots shows the numeral was read but the one-to-one match slipped.

6. Two groups of dots (four dots and three dots). Write the numeral and the number word.

Solution: Count through both groups without starting over: “one, two, three, four — five, six, seven.” $4 + 3 = 7$, so the numeral is 7

Number word (instructor-judged): the word is *seven*. Accept invented spelling that clearly reads as seven (such as “sevin”).

7. Ten-frame dots and the numeral card 9: write the numeral for the dots, then compare with $<$, $>$ or $=$.

Solution: Full top row is 5, count on “six, seven, eight”: $5 + 3 = 8$, so the dots show 8

Compare 8 with the card’s 9: when we count, 8 comes *before* 9, so 8 is less. $8 < 9$

8. Challenge: word card *six*, dot card, numeral card 5 — write each as a numeral, then order least to greatest.

Solution: Card A: the word *six* matches the numeral 6

Card B: count the dots one-to-one — the count ends at seven, so 7

Card C already shows the numeral 5. Now order all three by the counting sequence: 5 is said first, then 6, then 7. 5, 6, 7
