

Shape Detective: Any Way It Turns

Directions:

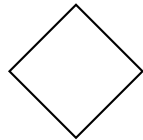

- A shape keeps its name no matter how it is turned or tilted.
- Count the straight sides and corners first — they tell you the name.

1. Look at this shape:

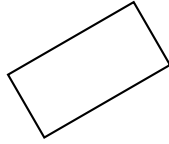

- (a) It has _____ straight sides.
(b) Its name is _____.

2. This shape is tilted so it stands on a corner:

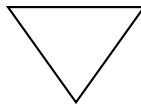

- (a) It has _____ sides, all the same length, and square corners.
(b) Even tilted, its name is still _____.

3. This shape is tipped over:

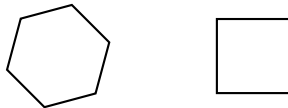

- (a) It has _____ sides. (b) It has _____ corners.
(c) Its name is _____.

4. This shape points down instead of up:

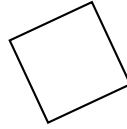

- (a) It has _____ corners.
(b) Its name is _____.

5. The hexagon has 6 sides. The square has 4 sides.

How many more sides does the hexagon have than the square? _____

6. Ben looks at this tilted shape and says, “That is a diamond, not a square!”

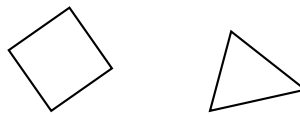

- (a) Count its sides: _____
(b) Is Ben right? Say why or why not.

7. Kim drew a shape with 3 straight sides. She made it very long, very skinny, and very tilted.

- (a) How many corners must her shape have? _____
(b) What is the name of her shape? _____

8. Challenge!

The square has 4 corners and the triangle has 3 corners.

- (a) How many corners do the two shapes have all together? _____
(b) Does turning a shape change its name? Say why or why not.
