

Anchor Facts: Twos, Fives, and Tens

Directions

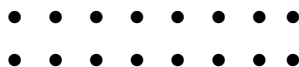

- An **anchor fact** is a fact you already know well — your twos, fives, and tens.
- Harder facts sit right next to an anchor: one more group, one less group, or a double.
- Each model below shows how an anchor connects to the fact — fill in every blank.

1. Count by fives. Fill in the three missing numbers:

5, 10, 15, _____, _____, _____

The 6th number you say is 5×6 .

2. This array has 2 rows with 8 dots in each row.

It shows a twos fact and a double at the same time:

$$2 \times 8 = \underline{\hspace{2cm}} \quad \text{and} \quad 8 + 8 = \underline{\hspace{2cm}}$$

3. Tens are the easiest anchors of all — just say the number and add a zero as you skip count:

$$10 \times 4 = \underline{\hspace{2cm}} \quad 10 \times 8 = \underline{\hspace{2cm}}$$

4. Use doubling. First the twos anchor, then double it:

$2 \times 6 =$ _____ so $4 \times 6 =$ double that $=$ _____

- 5.** Use the fives anchor, then add one more group of 8:

$$5 \times 8 = \underline{\hspace{2cm}} \quad \text{so} \quad 6 \times 8 = 5 \times 8 + 8 = \underline{\hspace{2cm}}$$

- 6.** Use the tens anchor, then take one group of 6 away:

$$10 \times 6 = \underline{\hspace{2cm}} \quad \text{so} \quad 9 \times 6 = 10 \times 6 - 6 = \underline{\hspace{2cm}}$$

- 7.** Which anchor family helps most for 9×8 ? Circle one:

twos fives tens

Now use the anchor you circled to find it: $9 \times 8 =$ _____

- 8. Challenge.** Use any anchor fact to find 7×6 .

The anchor fact I used:

Answer: _____

$7 \times 6 = \underline{\hspace{2cm}}$

Explain in one sentence how your anchor helped.
