

Adding Two-Digit Numbers with Place Value

Directions:

- Every problem comes with a picture. Use the picture to think, then write the matching number sentence underneath it.
- Add the **tens** with the tens and the **ones** with the ones. Never let a ten and a one get added together.
- Show your thinking in the space, then write the total on the answer line.

How the pictures work. A tall bar is one *ten*. A small square is one *one*. An arrow on a number line is one *jump*.

- 1. Base-ten blocks.** Count the tens and the ones in each group, then add the two groups.

Tens altogether: _____ Ones altogether: _____

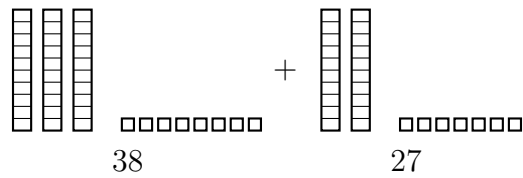

Answer: _____

- 2. Number line.** Start at 34. Jump the tens of 25 first, then the ones. Label each jump you make.

Answer: _____

3. Base-ten blocks. This one needs a trade. When ten ones are together, circle them and swap them for one ten.

Tens altogether: _____ Ones altogether: _____

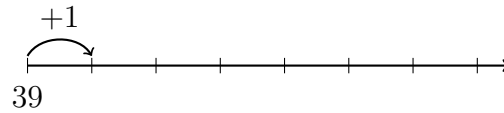

Answer: _____

4. Number line. Start at 46 and add 38 in jumps. Write the number you land on after each jump.

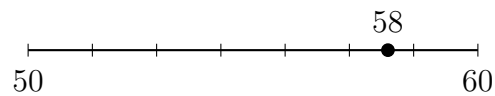

Answer: _____

5. Make a friendly ten. Rosa adds 39 and 24. She slides 1 over from the 24 so the first number becomes a ten. Finish her way and give back what she borrowed at the end.

Answer: _____

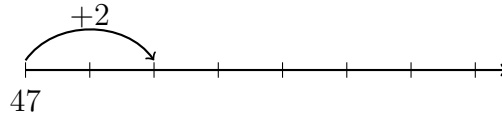

6. Estimate first. Round each number to the nearest ten, then add the two rounded numbers. Use the number line to decide which ten 58 is closer to.

About how much is $58 + 34$?

Answer: _____

7. Friendly ten again. Add 47 and 28. This time make the *second* number friendly: give it 2 so it becomes a ten. Show what you do with the 2 at the end.

Answer: _____

8. Find the mistake. Here is how one student added. Explain in one sentence what went wrong, then write the correct total.

$$\begin{array}{r} 46 \\ + 27 \\ \hline 613 \end{array}$$

What went wrong? _____

Answer: _____
