Teen Numbers: One Ten and Some Ones

Use this reference while completing your worksheet or when studying.

Every teen number is one ten and some ones.

$$11 = 10 + 1 \quad 12 = 10 + 2 \quad 13 = 10 + 3 \quad 14 = 10 + 4 \quad 15 = 10 + 5$$

$$16 = 10 + 6 \quad 17 = 10 + 7 \quad 18 = 10 + 8 \quad 19 = 10 + 9$$

1. Building a teen number

Fill one ten-frame all the way up — that is the ten. Put the leftovers in the next frame — those are the ones. Then say it: *ten and some ones*.

Example: One full frame and one frame with four counters. How many?

Step 1. The first frame is full, and a full frame always holds ten — so count only the second frame.

Step 2. The second frame has four counters, so the number is ten and four.

So the number is **14**.

Try it: One full frame, and two counters in the next frame. How many?

check: 12

2. Breaking a teen number apart

Going the other way: take the ten out first, and whatever is left is the ones. The ones of a teen number are never more than nine, because ten more would fill a second frame.

Example: 16 is one ten and how many ones?

Step 1. Take out the ten first — one full frame — and only then count what is left.

Step 2. Sixteen with ten taken away leaves the ones. So 16 is one ten and **6** ones.

Try it: 13 is one ten and how many ones?

check: 3 ones

3. Comparing two teen numbers

Both teen numbers already have one ten each, so the tens tie. Cover them up and compare the *ones*. The bigger ones make the bigger number. Write $<$ for *is less than* and $>$ for *is greater than* — the open mouth always faces the bigger number.

Example: Which is less, $10 + 3$ or $10 + 8$?

Step 1. Both have one ten, so the tens cannot decide it — compare the ones instead.

Step 2. Three ones against eight ones: three is the smaller pile. So **$13 < 18$** .

Try it: Write $<$ or $>$ between $10 + 6$ and $10 + 2$.

check: $16 < 12$

(!) **Watch out:** the ones of a teen number are the *leftovers*, not the whole number. 15 is one ten and 5 ones — never one ten and 15 ones.
