

Two-Digit Subtraction with Place-Value Models

How to work:

- A **ten rod** is a stick of ten little cubes. A **ones cube** is one little cube.
- Take away the tens first, then the ones. If there are not enough ones, **break one ten rod into ten ones** and try again.
- Show your thinking in the empty space — draw, cross out, or write the numbers. Then write your answer on the line.

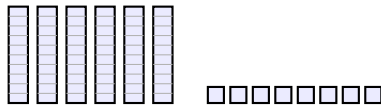

1. **Take away with blocks.** The blocks below show 47.

Cross out 2 ten rods and 3 ones cubes to take away 23. How many blocks are left? $47 - 23 =$

Answer: _____

2. **Take away with blocks.** The blocks below show 68.

Cross out the blocks that show 35. Write how many ten rods and how many ones cubes are left, then write the number. $68 - 35 =$ _____

Answer: _____

3. Round to the nearest ten, then subtract. Estimate $61 - 28$.

Round each number to the nearest ten and write the two rounded numbers on the lines.

_____ — _____

Now subtract the rounded numbers. About how big is the answer?

Answer: _____

4. Break a ten. Find $52 - 27$ using expanded form.

Start with $52 = 50 + 2$ and $27 = 20 + 7$. There are not enough ones to take 7 from 2, so break one ten: $52 = 40 + 12$. Finish the subtraction and write the difference.

Answer: _____

5. Break a ten. Find $83 - 46$ using expanded form.

Write 83 and 46 in expanded form, break one ten out of 83 so there are enough ones, then take away the tens and the ones.

Answer: _____

6. Estimate, then check. Ravi is finding $85 - 47$.

- First estimate: round each number to the nearest ten and subtract.
- Then find the exact answer to $85 - 47$ by breaking a ten.
- Write both numbers, and say whether the exact answer is close to the estimate.

Answer: _____

7. Sticker album. Nadia had 74 stickers. She glued 58 of them into her album. How many stickers does she have left?

Draw ten rods and ones cubes for 74, cross out 58, and write the number that is left.

Answer: _____ stickers

8. Find the mistake. Theo works out $63 - 29$ like this:

$$60 - 20 = 40 \quad 9 - 3 = 6 \quad \text{so } 63 - 29 = 46$$

Theo took the smaller ones digit away from the larger one instead of breaking a ten. Explain what he should have done, then write the correct difference.

Answer: _____
