

Two-Step Equations Practice

Solving two-step equations with positive and negative coefficients, division form, and checking solutions by substitution

Directions

- Undo the addition or subtraction first, then undo the multiplication or division.
- Show every step, and keep both sides of the equation balanced.
- When a problem says *check*, substitute your answer back into the original equation and show that the two sides are equal.
- Write your final answer on the answer line.

1. Solve for x : $3x + 7 = 22$

Answer: _____

2. Solve for x : $5x - 8 = 27$

Answer: _____

3. Solve for x : $4x + 9 = 41$

Answer: _____

4. Solve for x : $2x + 15 = 9$

Answer: _____

5. Solve for x : $\frac{x}{4} + 6 = 10$

Answer: _____

6. Solve for x , then **check** your solution by substituting it back into the original equation.
 $9x + 14 = 77$

Answer: _____

7. Maya solved the equation $6x - 5 = 31$ and wrote $x = 4$. Substitute $x = 4$ into the left side of her equation to find the value it really produces, then solve the equation correctly.

Answer: _____

8. Solve for x , then **check** your solution. $-3x + 11 = 2$

Answer: _____

9. Solve for m : $\frac{m}{3} - 7 = -2$

Answer: _____

10. Solve for x : $12 - 5x = -13$

Answer: _____

11. Solve for x , then **check** your solution by substituting it back into the original equation.
 $-4x - 9 = 15$

Answer: _____

- 12.** Solve for x , then **check** your solution. $5(x - 3) = 45$

Answer: _____
