

# Unit Fractions in Area Models

---

*Naming the unit fraction for one shaded part, checking that the parts really are equal, and comparing unit fractions drawn in same size shapes*

## How to name one shaded part.

- First check that all the parts are the *same size*. If they are not, the piece has no fraction name yet.
- Count how many equal parts the whole shape is cut into. That number goes on the *bottom*.
- One shaded part means the number on *top* is 1. A fraction with 1 on top is called a **unit fraction**.

**1.** This rectangle is cut into equal parts. Count the parts, then write the fraction for the shaded part.

Answer: \_\_\_\_\_

2. This circle is cut into equal parts. Write the fraction for the shaded part.

Answer: \_\_\_\_\_

3. Count the equal parts in this square — count the *parts*, not the lines that make them. Then write the fraction for the shaded part.

Answer: \_\_\_\_\_

4. Both bars are cut into six pieces, but only one of them is cut into six *equal* pieces. Write the fraction for the shaded piece of the bar that has equal pieces. Then draw a big X on the bar whose shaded piece cannot be named that way.

Answer: \_\_\_\_\_

5. The long bar is one whole, cut into equal parts. The little strip beside it is exactly one of those parts. What fraction of the whole bar is the little strip?

Answer: \_\_\_\_\_

6. Both rectangles are the same size. Each one has one equal part shaded. Which shaded piece is bigger? Write  $>$  or  $<$  in the blank so the sentence is true.

$$\frac{1}{3} \text{ ————— } \frac{1}{6}$$

Answer: \_\_\_\_\_

7. All three squares are the same size, and each one has one equal part shaded. Write the three shaded fractions in order, smallest first.

A

B

C

Answer: \_\_\_\_\_

**8.** Sam looks at this shape and says the shaded piece is one third, because the shape is cut into three pieces. Look carefully at the three pieces. Write one sentence saying why Sam cannot call the shaded piece one third, and what would have to change first.
