

Subtracting Across a Zero

subtracting across a zero in the tens place, subtracting from a number that ends in two zeros, estimating a difference to the nearest hundred, and finding a regrouping mistake

Directions

- Work right to left, ones first. A column that cannot give enough has to borrow from the column on its left.
 - A zero has nothing to lend. Go one more column left, open a hundred into ten tens, and *then* lend a ten to the ones.
 - Whenever a column lends, cross out its digit and write the smaller number above it — both times.
-

1. Subtract.

$$\begin{array}{r} 305 \\ - 142 \\ \hline \end{array}$$

Difference: _____

2. Subtract.

$$\begin{array}{r} 604 \\ - 271 \\ \hline \end{array}$$

Difference: _____

3. Subtract. Here the ones column needs help and the tens column has nothing to lend.

$$\begin{array}{r} 703 \\ - 258 \\ \hline \end{array}$$

Difference: _____

4. Subtract. This number ends in two zeros.

$$\begin{array}{r} 400 \\ - 176 \\ \hline \end{array}$$

Difference: _____

5. First estimate, then subtract exactly.

(a) Round each number to the nearest hundred, then subtract the rounded numbers. $802 - 375 \approx$ _____

(b) Now find the exact difference. $802 - 375 =$ _____

6. Subtract. This number ends in two zeros.

$$\begin{array}{r} 600 \\ - 248 \\ \hline \end{array}$$

Difference: _____

7. A theatre has 507 seats. On Friday night 349 of them were taken. How many seats were empty?

$$\begin{array}{r} 507 \\ - 349 \\ \hline \end{array}$$

Answer: _____ seats

8. Rosa worked out $500 - 236$ and wrote 364.

(a) Subtract correctly. $500 - 236 =$ _____

(b) Explain what Rosa did wrong.

9. Subtract.

$$\begin{array}{r} 900 \\ - 457 \\ \hline \end{array}$$

Difference: _____

10. Estimate first, then use the estimate to judge your exact answer.

(a) Round each number to the nearest hundred, then subtract. $806 - 349 \approx$ _____

(b) Find the exact difference. $806 - 349 =$ _____

(c) Explain how the estimate tells you your exact answer is reasonable.
