

# Analyzing Transformations with Multiple Parameters

---

*Reading the parameters, evaluating a transformed function, and expanding the transformed rule*

## Directions

- Every rule on this sheet has the shape  $g(x) = a f(b(x - h)) + k$ . Work from the inside out:  $b$  and  $h$  act on  $x$ , and  $a$  and  $k$  act on the output.
- Where a table is given, use it as a picture of the parent function — but write the algebra too.
- Give exact values, not decimals.

1. Let  $f(x) = x^2$  and  $g(x) = 2f(x - 3) + 1$ . Find  $g(5)$ .

Answer: \_\_\_\_\_

2. Let  $f(x) = x^2$  and  $g(x) = f(x + 4) - 7$ .

(a) Find  $g(-2)$ .

Answer: \_\_\_\_\_

- (b) Describe, in order, the transformations that take the graph of  $y = f(x)$  to the graph of  $y = g(x)$ . Name the direction of each shift.

Answer: \_\_\_\_\_

3. Let  $f(x) = x^2$  and  $g(x) = -\frac{1}{2}f(x+4) - 3$ . Write  $g(x)$  in expanded form  $ax^2 + bx + c$ .

Answer: \_\_\_\_\_

4. Let  $f(x) = x^2 + 3$ . Its values are shown below.

|        |    |    |   |   |   |
|--------|----|----|---|---|---|
| $x$    | -2 | -1 | 0 | 1 | 2 |
| $f(x)$ | 7  | 4  | 3 | 4 | 7 |

Let  $g(x) = f(2x) - 5$ .

- (a) Find  $g(1)$  using the table.

Answer: \_\_\_\_\_

- (b) Find  $g(2)$ . (The table stops before you need it — use the rule for  $f$ .)

Answer: \_\_\_\_\_

**5.** Let  $f(x) = \sqrt{x}$  and  $g(x) = -3f(x) + 2$ .

(a) Find  $g(9)$ .

Answer: \_\_\_\_\_

(b) Describe, in order, the transformations that take  $y = f(x)$  to  $y = g(x)$ .

Answer: \_\_\_\_\_

**6.** Let  $f(x) = x^2 - 4x$  and  $g(x) = f(x - 2) + 5$ . Write  $g(x)$  in expanded form  $ax^2 + bx + c$ .

Answer: \_\_\_\_\_

7. Let  $p(x) = x^3$  and  $q(x) = -p(x - 1) + 2$ . Complete the table.

|        |   |   |   |
|--------|---|---|---|
| $x$    | 0 | 1 | 3 |
| $q(x)$ |   | 2 |   |

- (a) Find  $q(0)$ .

Answer: \_\_\_\_\_

- (b) Find  $q(3)$ .

Answer: \_\_\_\_\_

8. Let  $f(x) = x^3$  and  $g(x) = f(6 - x)$ .

- (a) Find  $g(2)$ .

Answer: \_\_\_\_\_

- (b) Rewrite the input in the form  $-(x - h)$ , then describe, in order, the two transformations that take  $y = f(x)$  to  $y = g(x)$ .

Answer: \_\_\_\_\_

**9.** Let  $f(x) = \sqrt{x}$  and  $g(x) = 3f(2x - 8) + 1$ . Rewrite  $g(x)$  in the form  $a\sqrt{b(x - h)} + k$ , so that every parameter can be read off directly.

Answer: \_\_\_\_\_

**10.** Let  $g(x) = 4x^2 + 24x + 41$ .

(a) Complete the square to write  $g(x)$  in the form  $a(x - h)^2 + k$ .

Answer: \_\_\_\_\_

(b) Describe, in order, the transformations that take  $y = x^2$  to  $y = g(x)$ , and say why the order of the last two matters.

Answer: \_\_\_\_\_
