

Skills Summary

Sign Errors in Parabola Transformations

Use this reference while completing your worksheet or when studying.

Vertex form: $y = a(x - h)^2 + k$ vertex (h, k) , axis of symmetry $x = h$.

The one question that settles every sign: *what value of x makes the squared factor zero?* That value **is** h . Read h that way and you never have to remember a direction rule.

a multiplies **outputs**: $|a| > 1$ stretches, $0 < |a| < 1$ compresses, and $a < 0$ flips the parabola over its own vertex. a never moves the vertex.

Skill 1 — Reading the vertex out of the form (vertex-from-form)

Rule: the horizontal shift goes *opposite* the printed sign, because the form subtracts h .

$(x - 5) \Rightarrow h = 5$: right 5

$(x + 3) \Rightarrow h = -3$: left 3

The vertical part has no such twist: $+k$ is up, $-k$ is down.

Example: Find the minimum value of $y = (x - 5)^2 - 2$.

Step 1. The minimum of an upward parabola happens at the vertex, so I need h — the x that makes the squared factor zero.

Step 2. $x - 5 = 0$ gives $x = 5$ (right 5, not left). Then $y = (5 - 5)^2 - 2 = 0 - 2. \Rightarrow$ minimum value = -2 at the point $(5, -2)$

Try it: Find the minimum value of $y = (x + 3)^2 + 4$.

check: 4

Skill 2 — Writing the equation from a description (transform-to-equation)

Build it in this order: reflection and stretch into a , horizontal shift inside the parentheses (*opposite* sign), vertical shift outside (same sign).

right p : $(x - p)$ left p : $(x + p)$ up q : $+q$ down q : $-q$ reflect over the x -axis: $a < 0$

Example: Reflect $y = x^2$ over the x -axis, shift right 4 and down 1. What is the value at $x = 6$?

Step 1. Each described move maps to one slot of $a(x - h)^2 + k$, so I write the equation first and only then substitute.

Step 2. $a = -1$, right 4 gives $(x - 4)$, down 1 gives -1 : $y = -(x - 4)^2 - 1$. Then $y(6) = -(6 - 4)^2 - 1 = -4 - 1. \Rightarrow -5$

Try it: Reflect $y = x^2$ over the x -axis, shift left 3 and up 2. What is the value at $x = -1$?

check: -2

Skill 3 — Finding and fixing a sign error (find-and-fix)

How to audit someone's work in three checks:

1. Does their h make the squared factor zero? If not, the shift direction is flipped.
2. Is their vertex value the largest or smallest output? A wrong h still gives a real point — it is just not the vertex.
3. Did the sign of a survive? Losing it turns a maximum into a minimum.

Example: A student says the vertex of $y = (x + 6)^2 - 5$ is at $x = 6$ and the minimum is 139. Fix it.

Step 1. Check 1 first: does their h zero the squared factor? $6 + 6 = 12 \neq 0$, so their h is the culprit.

Step 2. $x + 6 = 0$ gives $x = -6$, so $y = (-6 + 6)^2 - 5 = 0 - 5$. Their 139 is $y(6)$ — a genuine point on the curve, just not the lowest. $\Rightarrow$ true minimum = -5 at $(-6, -5)$

Try it: A student reports the vertex of $y = (x - 4)^2 - 6$ as $x = -4$ with minimum 58. What is the real minimum?

9— :xæp

(!) **Watch out:** A wrong h almost never produces an obviously silly number — it produces a real point on the parabola, which is why these errors survive. Always test the candidate vertex by checking that the squared factor is zero there. And remember that a negative a reflects the graph without moving it: the shifts stay exactly where h and k put them.
