

Fractions on the Number Line

Reading points, placing fractions, and comparing them on a number line

Directions:

- On every line below, the space from 0 to 1 is cut into equal parts. Count the parts to find the size of one jump, then count the jumps from 0.
- Write fractions as $\frac{\text{jumps}}{\text{parts in one whole}}$.
- Show your counting on the line if it helps, and write your final answer on the answer line.

1. The whole from 0 to 1 is cut into 4 equal parts. What fraction does the marked point show?

Answer: _____

2. This whole is cut into 3 equal parts. What fraction does the marked point show?

Answer: _____

3. This whole is cut into 8 equal parts. What fraction does the marked point show?

Answer: _____

4. The whole below is cut into 6 equal parts.

- (a) Put a dot on the line at $\frac{5}{6}$.
 (b) How many jumps of $\frac{1}{6}$ from 0 is that? _____

5. This line keeps going past one whole, and every part is a half.

- (a) Put a dot on the line at $\frac{3}{2}$.
 (b) How many jumps of $\frac{1}{2}$ from 0 is that? _____

6. Both points below sit on the same line of eighths. Write $>$, $<$, or $=$ in the blank:
 $\frac{3}{8}$ _____ $\frac{5}{8}$

7. This line runs from 0 past 1, and every whole is cut into 3 equal parts. What fraction does the marked point show?

Answer: _____

8. The top line is cut into fourths and the bottom line into sixths. One point is marked on each. Write $>$, $<$, or $=$ in the blank: $\frac{3}{4}$ _____ $\frac{3}{6}$

9. The whole below is cut into 8 equal parts.

- (a) Put a dot on the line at $\frac{6}{8}$.
- (b) How many jumps of $\frac{1}{8}$ from 0 is that? _____

10. The two lines below are exactly the same length. The top one is cut into fourths and the bottom one into eighths, and $\frac{3}{4}$ is marked on the top line.

- (a) How many eighths reach exactly the same point? _____
- (b) Explain how the two lines show that those two fractions name the same point.
