

# Data Displays and Shapes — Mixed Review

Reading data displays, testing shape attributes, and using both together

**Directions:** Three references are printed below. Each problem says which one to use; some problems need a display *and* a shape fact together, so read the question before you start counting.

## Bar Graph A — Shapes in the class shape box

## Line Plot B — Number of sides on each cut-out shape the class made

## Shape Set — four shapes, labelled P, Q, R and T

P

Q

R

T

1. Use Bar Graph A. How many rectangles are in the shape box?

Answer: \_\_\_\_\_

2. Use Bar Graph A. How many shapes are in the box altogether?

Answer: \_\_\_\_\_ shapes

3. Use Bar Graph A. How many more squares are there than trapezoids?

Answer: \_\_\_\_\_

4. Use the Shape Set. How many square corners does shape R have?

Answer: \_\_\_\_\_

5. Use Bar Graph A. A quadrilateral is a shape with four straight sides, so the squares, the rectangles and the trapezoids are all quadrilaterals — the triangles are not. How many quadrilaterals are in the shape box?

Answer: \_\_\_\_\_ shapes

6. Use the Shape Set. How many pairs of parallel sides does shape T have?

Answer: \_\_\_\_\_

7. Use Line Plot B. How many cut-outs have 4 sides?

Answer: \_\_\_\_\_

8. Use Bar Graph A. The shapes with four square corners are the squares and the rectangles. How many shapes in the box have four square corners?

Answer: \_\_\_\_\_ shapes

9. Use the Shape Set.

- (a) How many of the four shapes have four equal sides? \_\_\_\_\_
- (b) All four shapes have four sides, but they are not all in that group. Explain why having four sides is not enough.

10. Use Bar Graph A. How many more rectangles are there than triangles?

Answer: \_\_\_\_\_

**11.** Use Line Plot B. Every cut-out with four sides is a quadrilateral. How many more quadrilateral cut-outs are there than five-sided cut-outs?

Answer: \_\_\_\_\_

**12.** Use Line Plot B. The class makes 2 more cut-outs, and both of them are squares.

- (a) How many cut-outs will have 4 sides then? \_\_\_\_\_
- (b) Explain what happens to the tallest column, and why the number of three-sided cut-outs does not change.
