

Multiplying by a One-Digit Number

Multiplying three- and four-digit numbers by one digit, estimating a product by rounding, and using multiplication to answer story questions

How to work these problems.

- Stack the numbers so the ones digits line up. Multiply the one-digit factor by each digit of the other number, starting at the ones place.
- When a partial product reaches ten or more, write its ones digit and *regroup* the tens digit into the next column. Multiply first, then add the regrouped digit.
- Every place gets multiplied — including a zero. A zero column is not a column you skip.
- Show the regrouped digits. A grader can find a slip in one column much faster than in one wrong final answer.

1. Multiply. 214×3

Answer: _____

2. Multiply. 132×4

Answer: _____

3. Multiply. 476×5

Answer: _____

4. Multiply. 1243×3

Answer: _____

5. Round 4187 to the nearest thousand and use the rounded number to estimate 4187×6 . Then work out the exact product and see how close your estimate came.

Estimate: _____ Exact product: _____

6. Multiply. 3608×5

Answer: _____

7. A bakery packs 1275 dinner rolls into each delivery van. The bakery fills 6 vans this morning. How many rolls are loaded altogether?

Answer: _____

8. Multiply. 2749×8

Answer: _____

9. Round 5812 to the nearest hundred and use the rounded number to estimate 5812×7 . Then work out the exact product and see how close your estimate came.

Estimate: _____ Exact product: _____

10. Dana multiplied 1806×5 and wrote 9000. Her answer is not right. Describe the mistake she made in the tens column, then find the correct product.

Answer: _____

11. Multiply. 4975×9

Answer: _____

12. A school orders 8 cartons of printer paper, and each carton holds 2350 sheets. During the first week the school uses 4000 sheets. How many sheets of the order are left?

Answer: _____
